

Certification

Introduction to NLP and LLMs: Principles and Practical Applications

Course completed by Turin Sayed
Sep 20, 2026 at 10:10AM UTC • 1 hour 39 minutes

Top skills covered

Large Language Models (LLM)

Natural Language Processing (NLP)

Artificial Intelligence (AI)

Shea Hanson, Head of Learning Content Strategy

Certificate ID: da6f016d89da7e183f3ebf096a5f9f8a7bd218a74d4eaa924544639c890b8c61

Course Summary / Notes

Course Summary / Notes

From this course, I learnt more about how NLP and Large Language Models work and how they can be used to help computers communicate with people. My main understanding is that NLP helps a system process and understand human language, while LLMs can use that information to generate responses that sound more natural. The course also showed how text can be broken down and processed so that an AI system can better understand what a user is asking. I learnt that NLP and LLMs are already used in things like chatbots, virtual assistants, summarising text and analysing what people are saying. Something else I took from the course was that creating an AI system isn't just about getting it to respond correctly. You also have to think about things like the accuracy of its answers, bias, privacy and how user data is being handled. Overall, the course gave me a better understanding of how LLMs and NLP can be used in real applications and some of the things we need to think about when implementing them.

Concepts That Could Be Applied to Our Project

A few concepts from this course could be useful for our Telstra Robotics and NLI project, especially since we are already working with an LLM for Haku. One idea is using NLP to help Haku better understand what a person is actually asking instead of only responding to specific commands. This could make conversations with Haku feel more natural and allow users to ask the same question in different ways. We could also connect the LLM to relevant Telstra information so Haku can answer customer questions and provide useful information when needed. Another thing I learnt from the course is that we need to test the responses the LLM gives rather than assuming they are always correct. We could test Haku with different types of questions and see how accurate and useful its answers are. Privacy is also something we would need to consider if Haku is interacting with real customers. Overall, these concepts could help us make Haku's conversations more natural, useful and reliable.
